Date: 09-05-2023

Machinability

The machinability of an alloy is similar to the palatability of wine – easily appreciated but not readily measured in quantitative terms.

Edward M. Trent

H Opitz, W König, 1968

Batch-to-batch material variation in a micro-alloyed steel

- Up to 17% variation in yield strength ($R_{p0.2}$)
- Up to 15% variation in tensile strength (R_m)
- Variations in hardness
- Variations in oxide type/amount according to ASTM E45
- Variations in amount of carbo-nitride former elements

(Ti,V)(C,N) precipitates:

- Control grain growth during austenitisation & forging
- Influence mechanical properties

Casting

- **Non-metallic inclusion** type, size & amount
- Amount of free nitrides

Do not have major impacts on mechanical properties.

Thermo-mechanical processes

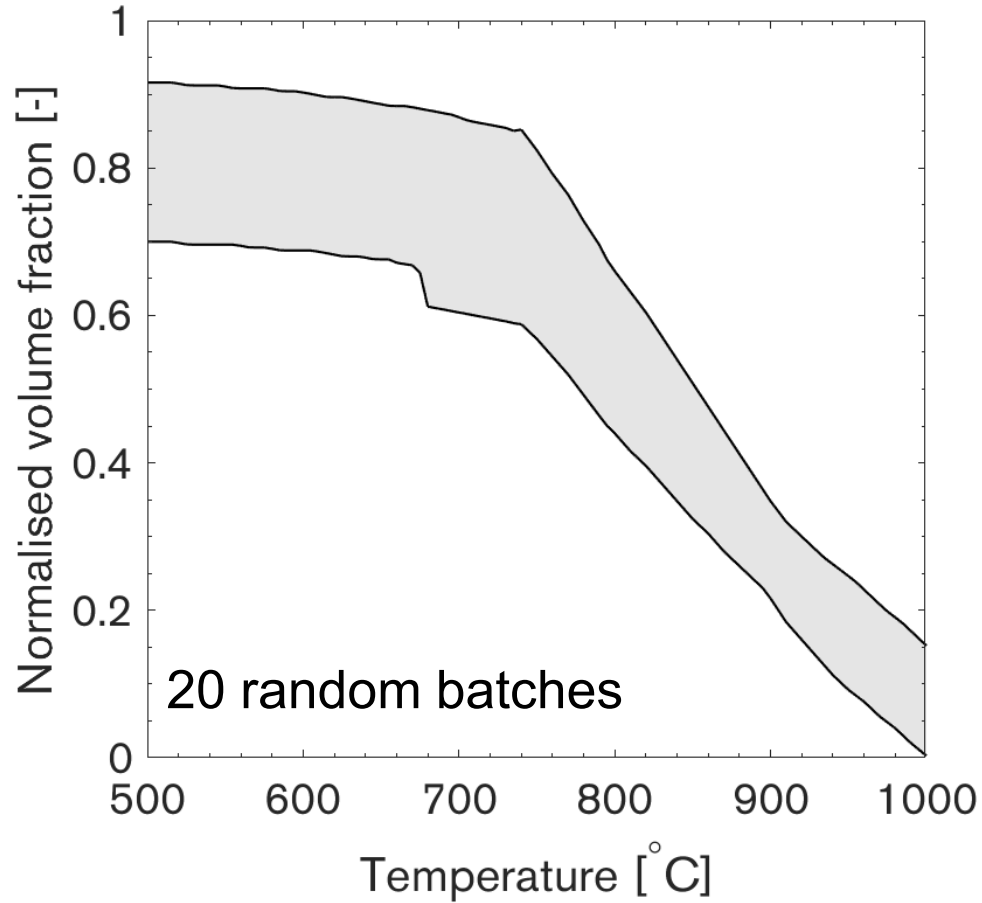

- Pearlite lamellar spacing
- Pearlite colony size
- Prior-austenite grain size
- Amount of precipitants
- Prior work-hardening

Do have significant impacts on mechanical properties.

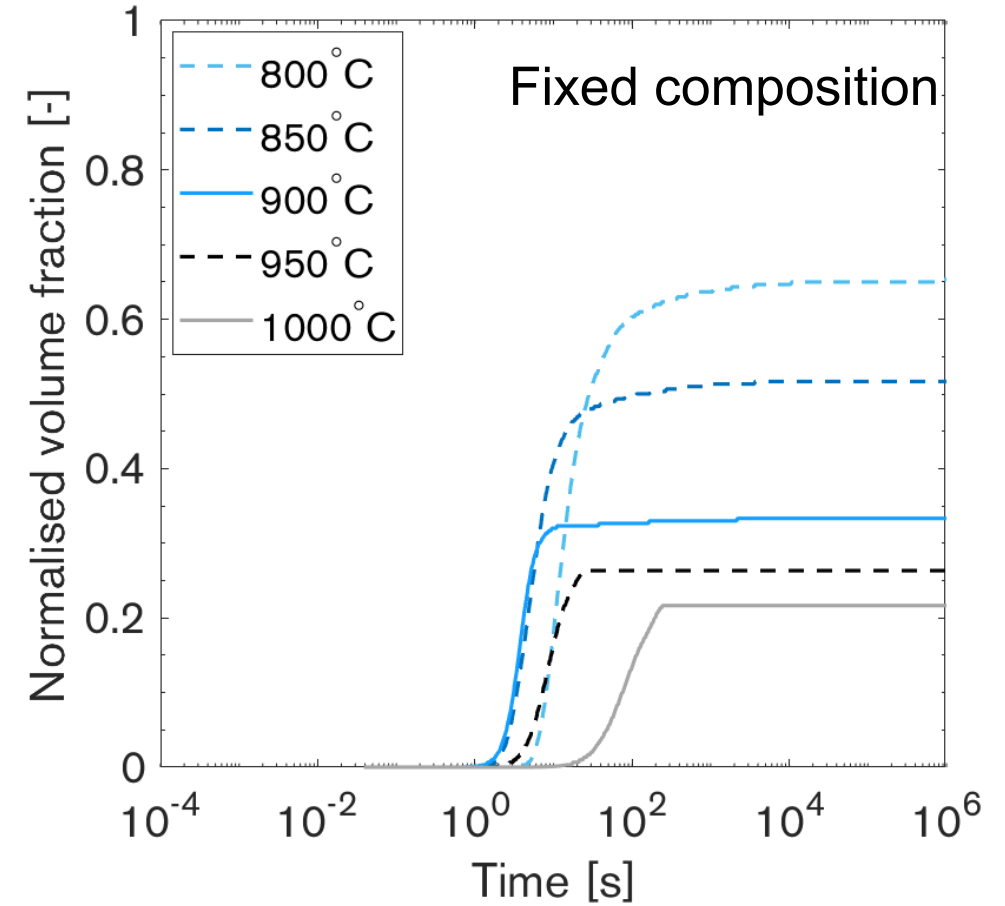

Effects of thermo-mechanical processes

Batch-to-batch variations

Variations in the equilibrium amount (volume fraction) of $(V,Ti)(C,N)$ precipitates

Normalised volume fraction of $(V,Ti)(C,N)$ with aging time under different isothermal conditions

Flow stress properties of (micro-alloyed) steels

- Chemical composition (solid-solution)
- Pearlite lamellar spacing
- Ferrite grain size
- Volume fraction of (V,Ti)(N,C) precipitates
- Size of (V,Ti)(N,C) precipitates
- Prior work hardening – dislocation density

No.	V_{Pearlite} (-)	D_{Ferrite} (μm)	V_{TiVCN} (-)	D_{TiVCN} (nm)	$\lambda_{\text{Pearlite}}$ (μm)
1	0.2	20	-	-	0.2
2	0.5	20	-	-	0.2
3	0.5	20	0.002	10	0.2
4	0.3	5	0.002	10	0.2
5	0.6	10	0.001	10	0.4

Effects of non-metallic inclusions

Batch-to-batch material variation in steels

Non-metallic inclusion within the standard specifications **do not** have a major impact on mechanical properties **BUT** they can significantly influence the machinability of steels.

Non-metallic inclusions:

- Control the formation of a protective layer that can affect tool wear progression.
- Influence the contact length between the tool and the chip – thereby affecting the cutting temperature
- Can lead to abrasive tool wear depending on their type, size and amount.
- **Can thus improve the machinability of steels based on the deformability of the inclusions.**

Non-metallic inclusions – an example

An SEM and EDS analysis of the steels shows the complexity of the inclusions within the matrix.

Batch-to-batch material variation in steels

Batch 1

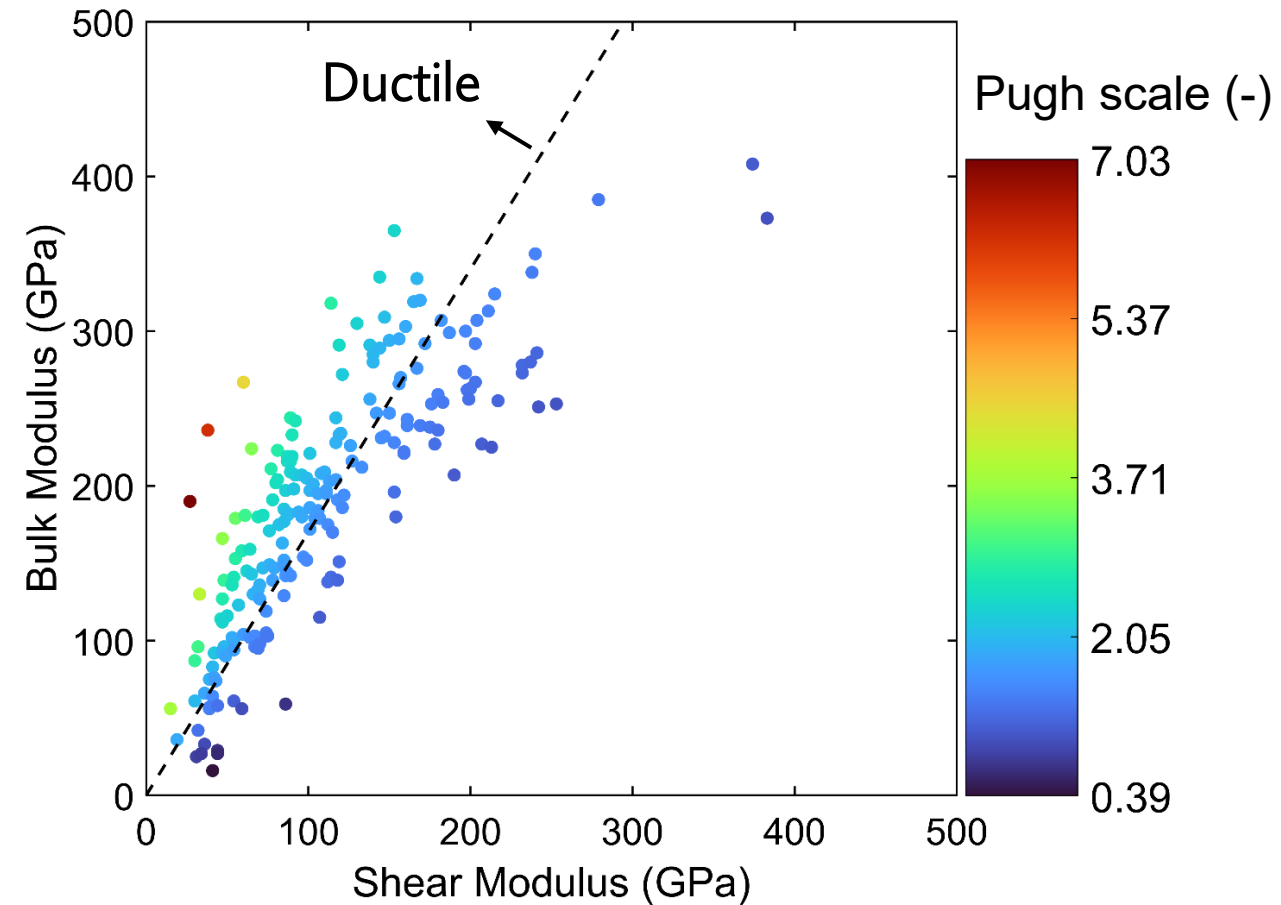

Batch 2

- Nitrides
- Oxides
- Sulfides
- Oxi-Sulfides

Hardness and ductility

Density Functional Theory (DFT) + Machine Learning (ML)

~**220** oxides, carbides, nitrides and sulfides have been analysed so far!

Hardness estimation of $\text{TiC}_{1-x}\text{N}_x$ carbo-nitrides

- A supercell including 32 Ti and 32 C atoms!
- 25%, 50%, 75% and 100% of C atoms (in TiC supercell) were replaced by N atoms (**randomly distributed**)!

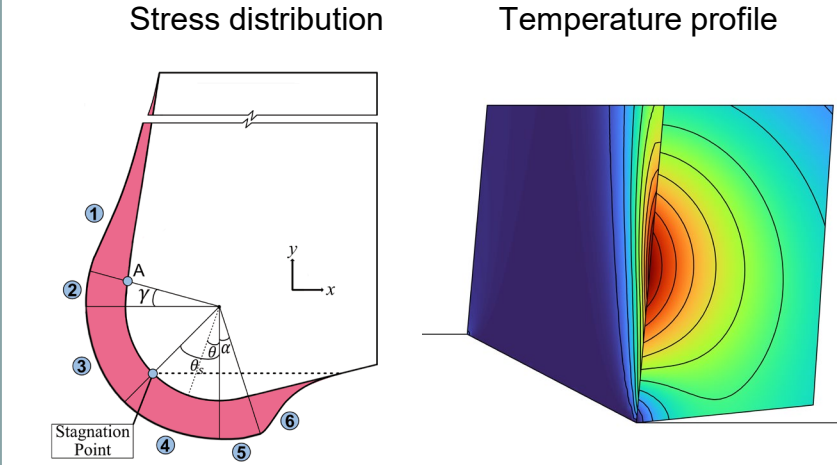

Physics-based machinability assessment

Physics-based platform

Physics-based constitutive model

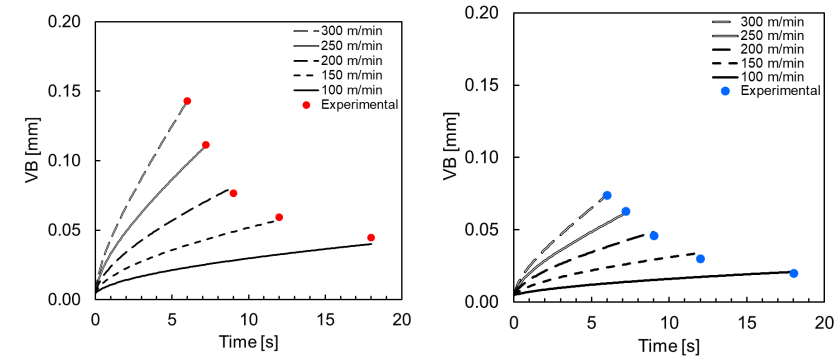

Estimation of thermo-mechanical loads

Physics-based wear model

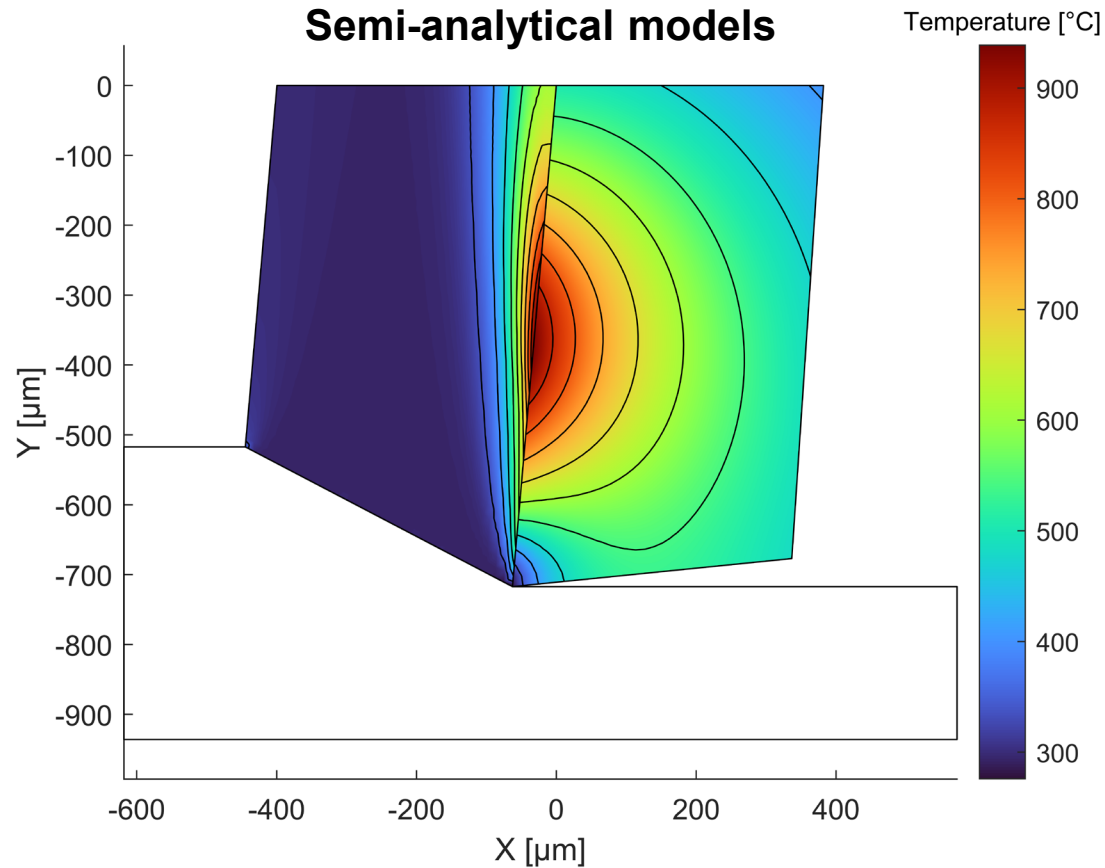

Physics-based wear estimation

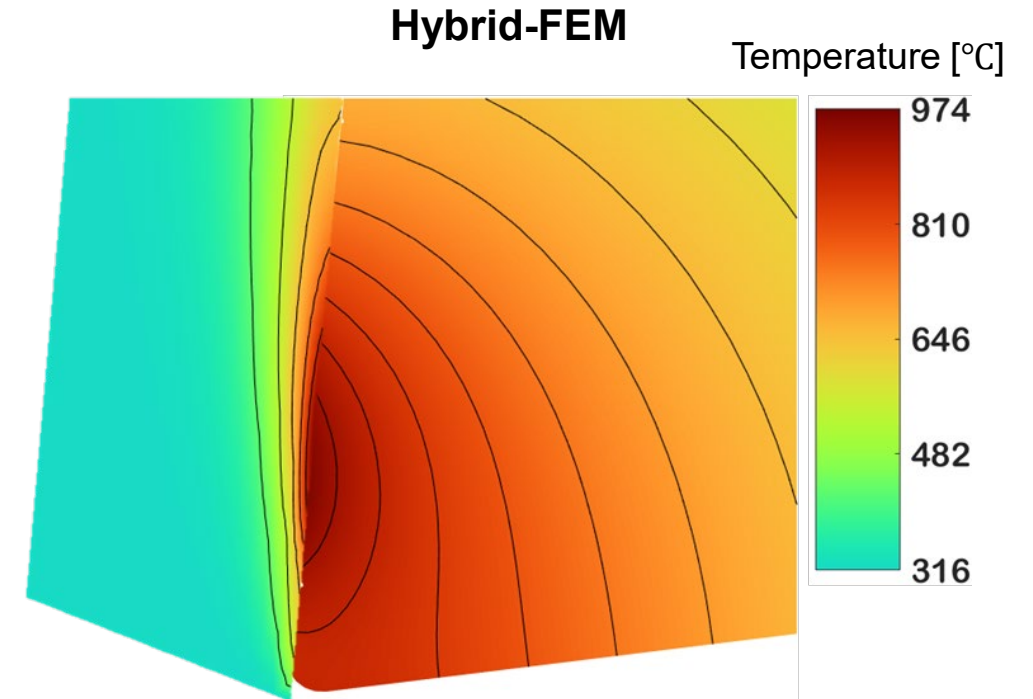

Machinability assessment

Simulation of interface temperature

- **Value** of the maximum temperature
- **Location** of the maximum temperature

- Good efficiency
- Good accuracy – less accurate near the cutting edge

- Better efficiency – calculates in **30-60 seconds!**
- Better accuracy – improved accuracy near the cutting edge

Inclusion properties

Inclusion type	$\mu(\mu\text{m}^2)$	$\sigma(\mu\text{m}^2)$	Vol%
MnS	10	2	0.08
CaAl ₂ (SiO ₄) ₂ (Anorthite)	24	5.9	0.02
Ca ₂ Al ₂ SiO ₇ (Gehlenite)	13	2.3	0.03

Microstructural properties

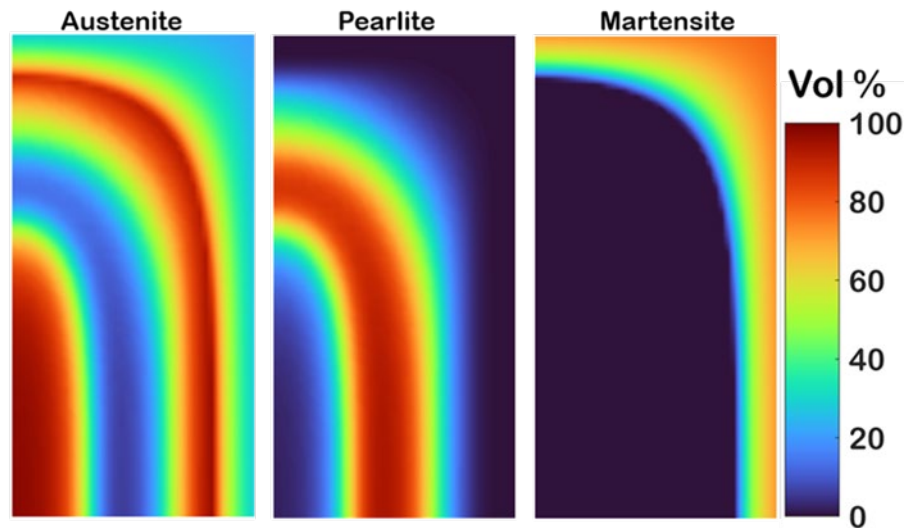

Interlamellar spacing (μm)	0.2	Dislocation density (m^{-2})	1e+11
Pearlitic colony size (μm)	54	Taylor factor	2.8
Prior-austenite grain size (μm)	65	Carbonitride amount (mole%)	0.4
Pearlite content (Vol%)	55	Carbonitride average size (nm)	20

Outlook

- Physics-based tool wear estimation when using coated and uncoated tools: Abrasion, dissolution-diffusion, oxidation & chemical interaction.
- Databases are being developed for Ni-, Ti- and Fe-based alloys. Extending the models for a practical range of strain rates and temperature.
- Coupled with microstructure simulation.

15 seconds of cooling – water quenching from 850°C

The screenshot shows the MCutSim software interface. The main window displays a 3D model of a tool with a simulation overlay. The 'Physics-based wear predictions' window is open, showing material properties, composition, and microstructural simulation results.

Background

Material certificates & data analytics

Background

Input: Chemical composition of all batches

Forging company A & B

Class 1: Steel supplier A

Class 2: Steel supplier B

Class 3: Steel supplier C

Class 4: Steel supplier D

Conclusion:

It is possible to determine the steel company based on the input materials in ~99% of the cases. There are differences in steel compositions specific to the steel mill.
